Epilepsy is a disease frequent in its occurrence and obstinate in its nature. Every expedient which promises the slightest chance of success in its cure, should be fairly and cautiously tested by a judicious course of experiments until we have become clearly and fully acquainted with its powers. All admit the propriety of such a proceeding. But, there are many obstacles which stand in the way of its adoption. Not to mention the general obduracy and fatality of the disease, most of the remedies which have been so confidently recommended for its cure, have either fallen into disuse, from their entire inefficacy, or are retained merely as palliations.

This would effectually dampen all spirit of inquiry were we not impudged with the belief that a failure in our attempts to cure diseases, is not attributable to the necessarily fatal nature of those diseases, but to the present imperfect state of Medical Science. Barring this in mind fresh vigour will be added to our exertions.

Among the numerous remedies recommended in Epilepsy is the oleum Terebinthinæ. Of

case it was in that disease has much excited the attention
of Physicians. And it is said to have proved successful in many
instances. With the view of testing its efficacy and of
ascertaining to what particular cases of the disease, it was
more especially adapted. I took up the consideration of the sub-
ject. I am well aware of the requisites which an Experimen-
talist should be possessed of in the pursuit of a subject of this
kind. Besides "say more, natural acuteness and sagacity, it
requires the exact weighing of every concomitant and collateral cir-
cumstance which can promote, retard or prevent the effect of
the medicine at the time it is administered." Confessing my
deficiency in this respect however, I am happy to state that
that deficiency was amply supplied by my able Preceptor
Dr. Bidlaw, in whose practice most of the cases I have de-
tailed occurred, and whose judgment guided me in the
application of the remedy.

With these introductory remarks, I proceed in the
first place to a detail of the Cases in which the Impe-
tine was exhibited, and propose next to make a few
remarks on each of them.

Jane, Aetate 26, of a Sphlegmatic Temperament, was placed under the care of a Medical Gentleman on the 10th of March 1815 for the Cure of Epilepsy, of which she had been the Subject the preceding twelve months.

From the excellent health she had enjoyed previous to its attack, and the good Character she bore as it respected sobriety and regular habits, no evident cause could be assigned for her disorder. At the time she applied for advice,

her menstruation was regular, and except the disease, her general health was in every other respect good.

She informed me that the fits observed were regularity in their recurrence at first: but that they had evidenced a disposition to become so for the last four months she having had three in that time at regular & equidistant periods.

October
the

Her system being somewhat excited, at the time she was first visited, it was deemed proper to reduce it to some degree before she commenced with the use of the Turpentine. This being effected, and the system thereby prepared for its reception, she was ordered, on the 19th of the month, to take a tea-spoonful of the turpentine, three times a day.

On the 2nd of April, twelve days after she began this plan of treatment, she had a fit, but which, she informed me, was more mild than any of the preceding ones. The medicine was now continued, with an occasional suspension of it, used to obviate strangury, until the middle of July, when, thinking herself cured, she refused to take any more of it.

It may be proper to state here, that during the whole treatment, the turpentine had no other sensible effect on her system, except that of exciting the pulse, which, however, was only evident during the first two weeks of its use.

October 20th 1816. It is now better than six months since she had the last fit.

Case 2nd

Miss M— Aetatis 12 of a delicate and feeble constitution, was seized with Epilepsy, on the 20th of June 1810. The attack was not preceded by any symptoms of indisposition. She had three fits on the 20th and two the succeeding day.

From the success that ~~had~~ attended the use of the Scam Terebinthina in the Epilepsy of Children, a short time since in Charleston, it was concluded to make a trial of it in this case.

The patient was accordingly ordered on the 21st of June, a small teaspoonful of the Turpentine in a little mucilage, morning and night.

On the 22nd she had two more fits. It was now thought prudent to give the same quantity of the medicine, three times a day.

On the 28th the Turpentine purged her and brought away by stool several worms. ✓

The cause of her fits being now made known, she was ordered a continuance of the medicine, with the view of divesting completely the alimentary canal of any mass of these animals.

It might have been left behind.

As worms, however, appearing by the 3^d of July it was concluded that the whole of them had been evacuated already. She was therefore ordered to discontinue its use.

October 22^d 1816 This young lady has continued well ever since.

Case 3^d

Child E. M. Aetat 14. a sister of the subject of the preceding case, was attacked with Epileptic fits in August 1816, nearly in the same way. Concluding from the circumstances of her sister's case, that the disease here originated likewise from worms in the Alimentary Canal, the Turpentine was immediately resorted to.

She took a large teaspoonful of the medicine, in mucilage, morning noon & night. In three days after she commenced its use, several worms were discharged by stool. This circumstance confirmed our suspicions.

The propriety of continuing its use a few days

longer was suggested to her Mother. but she strenuously objected to its giving as a reason, the sickening effects it had on her Child. However, notwithstanding this, the case terminated happily.

October 22nd 1816 This patient has also continued well ever since.

Case 5

On the 28th August 1816 Mr. J. R. Grocer requested medical assistance for his negro Girl, who had been the subject of Epilepsy the preceding nine months.

This Gentleman informed me, that he could not assign any probable cause for the disease, with which this unfortunate Girl was afflicted. He stated that she had had during the whole of this time, fits of Epilepsy every third week, but that on the 10th of the present month ten days before the regular period of its return, she had a very violent fit, and on the 20th the day on which he called in medical aid, she had

three severe ones in the course of two hours-

This increase in the violence of the fits, and the frequency of their recurrence, added to the total failure of every plan of treatment that had been adopted for their cure induced him at once to consent to a trial of the turpentine, the use of which, he had all along opposed-

This Girl was in her 18th year of a delicate constitution and regular in her menstruation-

On the night of the 26th her system being somewhat exhausted, as was evidenced by nervous tremors & a feeble pulse, she was ordered a little Rhenish Key & a suitable draught of Laudanum & the Compound Tincture of Castor to be taken at bedtime. Being in some measure revived on the morning of the 27th she commenced the use of the turpentine in the dose of $\frac{3}{4}$ by measure, in mucilage morning, noon & night-

On the 28th she had another fit. On the 3rd of September, the occurrence of thangury obliged us to suspend the turpentine for a few days. But by the 6th of the month, it entirely disappeared

and she resumed the use of the medicine -
From this time to the 15th of October, she continued
its use, as directed, with the happy effect of put-
ting a complete stop to the disease.

As the turpentine in the above case, had
a strong tendency to produce strangury it may
be proper to state, that its use was suspended
for a day or two at a time - whenever the symp-
toms of that disordering affection showed themselves.

October 15th 1816. It is now more than a twelve-
month since she discontinued the use of the Tur-
pentine, and has, much to my satisfaction con-
tinued well ever since -

Case 5

J. Mass. Seaman. Aetatis 30, was admitted into
the Marine Hospital of Charleston S. C. on the 16th
of May 1816, for the Cure of Epilepsy, with which
he had been afflicted upwards of a twelve month.

He informed me, that he was first attacked
with the disease sometime in March 1816, a
day or two after he had received some very

[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]

and too, hu

steping information respecting an unhappy change, which had taken place in his fortune.

Previous to this, he enjoyed uninterrupted health. The Physician attached to the above Institution judiciously put into practice, the remedies usually given in Epilepsy without any advantage. Guided by the state of the system, he was bled, purged and salivated; he took Bark. Zinc valerian. Copper and various other medicines.

As nothing which had hitherto been given had produced any good effect. I proposed to Dr. G. on the 2nd July 1810, a trial of the Turpentine; to this he readily assented. Mass was accordingly ordered a teaspoonful of the medicine in mucilage morning noon & night. It was taken from this time until the 3rd of Sept. unless without effecting any sensible change in the system.

On the 5th he had two fits and continued to have one daily for the three succeeding days.

His system at this juncture was much excited, his articulation difficult and his

[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]

[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]

and evidenced symptoms of Insanity.

In consequence of this state of things the temperance was immediately discontinued.

A continuance of the above mentioned unfavourable symptoms prevented his resuming the use of the medicine.

He died about the end of the month.

The symptoms that attended this unfortunate case, led us to suspect the existence of mischief in the Brain, - it was therefore agreed to examine it. Accordingly, twenty four hours after death, the head was opened, and the brain examined. It exhibited strong marks of high excitement. Continuing the dissection, we arrived at the cerebellum from which we obtained nearly $\frac{3}{4}$ of a ounce fluid.

Case 6

Mary Hemming 'a coloured woman Aetatis 26' of a robust habit of body was received as a patient by a Medical Gentleman in November 1816.

She has been the subject of Epilepsy from her

[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]

[Faint, illegible handwriting, possibly a signature or date.]

[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]

[Faint, illegible handwriting on the right edge of the page, possibly from the adjacent page.]

Childhood. It appears, she has an attack of her disease once in three months.

The gentleman who attended her informed me that from what he could learn of the origin of the disease in this case, he felt convinced it was hereditary. That notwithstanding this, he thought it both prudent and humane to make a trial of the Serpentine. - The following draught was ordered every second day.

℞. Pl. Scyllanthinae ℥j. Mucilag. Gum. Arab. ℥ij.
℞. - This plan was adhered to for two weeks, with the effect of purging her slightly.

Her Physician being of opinion that its operation in this way - "took away from the antiepileptic powers of the Serpentine" - he now ordered one half of the quantity to be taken at the same intervals - This she continued to take until the 20th of December without any disagreeable effects.

On the 26th of the month the period of the return then fell, she had a severe attack, which left her partially paralytic for the succeeding weeks.

to find
for the

convinced that the Turpentine here, was productive of
more real injury than any of the medicines she had
previously taken. it was left off entirely & calomel
taken in its stead.

The gentleman who favoured me with
the above case has since informed me, that the
Turpentine was tried a second time, but with
the same unfavourable result.

Having now given a brief and I
hope accurate account of a few of the cases
in which the Turpentine was exhibited, I pro-
ceed next to make a few remarks on each
of them -

By a reference to the first &
fourth Cases, it will be found, that the Turpen-
tine put a complete stop to the disease.
And it appeared to effect this, without any sensi-
ble evacuation from, or operation on the sys-
tem.

It is true, as is stated in Case No 1,
the pulse was somewhat excited during the
first few days of its use. and I may add

and w

such was the fact with respect to the other case.
it, but it soon lost this effect, in every instance.
It will be recollected also, that both of the sub-
jects of these two cases were regular in their men-
struation.

Feeling anxious to test fairly the efficacy of the
turpentine, I ordered the stools of these pa-
tients to be carefully examined, with a view
of ascertaining, whether there existed in the Al-
imentary Canal any worms, to whose presence
the disease might have been attributed. This
was done - but none were discovered.

Now, as there was no sensible evacuation
from the system - or discharge of worms, it
may be asked, how did the Turpentine operate
in curing these cases? I conceive it dif-
ficult to give a satisfactory reply. I shall
therefore, not make any attempt to approach
its solution, contenting myself with obser-
ving, that it probably acted by substituting
a new action for that of the disease and there-
by effected the Cure -

of the
gially

From the circumstances connected with the 2.^d and 3.^d Cases. it is evident that the disease in both of them was occasioned by the irritation of worms in the alimentary canal - for, as soon as they were evacuated, the fits immediately ceased.

The efficacy of the Turpentine then, in such cases is to be attributed to its anthelmintic power -

As Epilepsy does in some instances become confirmed by repetition, notwithstanding the removal of its cause. And as the Turpentine appears to exert a peculiar operation in curing the disease, when it proceeds from other causes than abdominal irritation. would it not be advisable to give it in all cases of Epilepsy proceeding from worms, in preference to other anthelmintics? A firm belief that many of the cases of Epilepsy in Children, originally the product of these vermin be:

come confirmed by repetition and are kept up
in this way - has induced me to propose the
foregoing question.

If the opinion be well founded and the tur-
pentine really effects the peculiar operation
alluded to, I would not hesitate to declare
it better adapted to these cases of Epilepsy
than any remedy heretofore recommended.

On the Case of Mary, little need be said.
His disease was evidently of mental origin,
and as such, there was little prospect of a
cure being effected.

Notwithstanding the great Caution that was
taken, not to exhibit the turpentine in
his case, when there existed any contra-
indication to its use, still it had the ef-
fect of increasing the frequency of the fits,
and of exciting considerable arterial ac-
tion.

From the history of the case and
the phenomena which the brain exhibited
upon dissection, I am clearly of opinion

Rev.

the turpentine hastened the appearance of the symptoms of Fatuity - which came on near the close of his existence - and I may safely add, shortened his life -

In the case of Mary Flemming the turpentine was productive of real injury - This was evinced by the paralytic condition in which the feet left her - while she was under its use

It will be recollected she made a second trial of the medicine, - but with the same unfavourable results.

Indeed the disease was of such long standing, that nothing favourable could have been expected from the turpentine - I say long standing - because, it is not reduced to a certainty - whether the disease in this case, was hereditary or not - Altho' this was the opinion of the gentleman who attended her -

In addition to the above cases.

think we
were

there were several others, in which I have seen the turpentine tried, but in none of them was the result favourable.

Two of these were of Hereditary origin. In one case the turpentine was perscribed in, from time to time, for six months without increasing the fits or affecting the system in any sensible degree. Notwithstanding this, the disease was not even palliated.

In another case, that of a Man *Ætatis* 40. who was addicted to drink - the turpentine had an injurious effect? The fits became so frequent & came on so suddenly & unexpectedly that the patient was afraid of leaving home unattended while he was under issue.

It was tried in the case of a married woman for some time - and I think with advantage. But the frequent occurrence of *thangury* obliged us to re-

linguish its use before a cure was effected

I have now given the result of my observations on the use of Turpentine in Epilepsy and from a review of what has been said, we may be allowed to come to the following conclusions.

First- That turpentine will be found well adapted to Epilepsy, proceeding from the irritation of worms in the Alimentary Canal

2^d. That in Epilepsy arising from other causes than worms, it will be found most useful in such cases as are of recent date and connected with a state of the system indicating the use of tonic remedies.

And

Lastly- that as far as I have seen it will prove either totally inefficient or exceedingly pernicious in all cases.
